Penile and bulbar urethroplasty Surgical techniques and results

Penile urethra

Basically, the surgical technique for the repair of penile urethral strictures is selected according to stricture etiology

Etiology of penile urethral strictures

- **Failed hypospadias repair**
- Lichen sclerosus
- Trauma
- Instrumentation
- **Catheter**
- Infection
- Other cause

In penile urethral strictures due to:

- Trauma
- Instrumentation
- Catheter
- Infection
- Other cause

The penis is normal: one-stage repair

In penile urethral strictures due to:

Failed hypospadias repair

Lichen sclerosus

The penis is abnormal: two-stage repair

One-stage penile urethroplasty

Flap or graft?

S.

One-stage flap urethroplasty

Dartos fascial flap with skin island

Penile urethral stricture involving external urinary meatus

T

T

Complications following one-stage flap or graft penile urethroplasty

One-stage penile flap or graft urethroplasty

| patients | type of repair | success |
|----------|----------------|---------|
| 18 | flap | 66.7% |
| 22 | oral graft | 81.8% |
| 23 | skin graft | 78.3% |

Barbagli G. et al, BJU Int 2008

Center for Reconstructive Urethral Surgery

\$

Basically, the choice between flap or graft one-stage urethroplasty should be made according to the status of the urethral plate and according to the surgeon's background, training and preference

Two-stage urethroplasty using oral mucosal graft

Penile urethral stricture in patient with failed hypospadias repair or lichen sclerosus

Complications following the first stage of urethroplasty

10-39% of patients showed scarring of the initial graft, requiring new grafting procedures

Barbagli et al., Eur Urol, 2006

Second stage

Complications following the second stage of urethroplasty

30% of patients showed complications following the second stage of urethroplasty, requiring surgical revision

Barbagli et al., Eur Urol, 2006

Conclusions

Two-stage penile urethroplasty using oral graft is not a simple procedure and requires great expertise to avoid a lot of traps

Moreover, this two-stage procedure, also in the hands of the skilled surgeon, showed a high complication rate, either following the first stage or the second stage

Bulbar urethra

Basically, the surgical technique for the repair of bulbar urethral strictures is selected according to the stricture length

Which type of urethroplasty ?

- 1 2 cm: end-to-end anastomosis
- 2 4 cm: augmented anastomotic repair
- > 4 cm: substitution urethroplasty

stricture associated with local adverse conditions: two-stage urethroplasty

Preparation of the patient

Simple lithotomy position

Preparation of the patient

Allen stirrups with sequential inflatable compression sleeves

1 - 2 cm bulbar urethral stricture

End-to-end anastomosis

Methylene blue is injected into the urethra

The distal extent of the stenosis is identified by inserting a 16-French catheter with a soft round tip

The urethra is freed from the bulbocavernous muscle

The urethra is dissected from the corpora cavernosa

The distal extent of the stenosis is identified and outlined

The urethra is transected at the stricture level

Center for Reconstructive Urethral Surgery

1

proximal end

distal end

T

The urethra is spatuled for 1 cm on both ends

A total of 10 interrupted 4-zero polyglactin sutures are put in place before tying

The anastomosis is completed on the roof

A Foley 16-French grooved silicone catheter is inserted and the urethra is closed

The anastomosis is completed

Results on 176 patients who underwent end-to-end anastomosis

Mean follow-up 75 months (12 – 273 months)

Center for Reconstructive Urethral Surgery

Y?

2 - 4 cm bulbar urethral stricture

Augmented anastomosic repair using oral graft

Two surgical teams work simultaneously

Center for Reconstructive Urethral Surgery

ST?

Two sets of surgical instruments

Oral mucosa

Urethroplasty

Appropriate mouth retractor

Only one assistant is needed to harvest the oral graft

Methylene blue is injected into the urethra

The distal extent of the stenosis is identified by inserting a 16-French catheter with a soft round tip

The distal extent of the stenosis is identified and outlined

The urethra is dissected from the corpora cavernosa

Center for Reconstructive Urethral Surgery

S

The urethra is transected at the stricture level

The distal and proximal urethral ends are mobilized from the

corpora cavernosa

The distal and proximal urethral ends are fully spatuled along the dorsal surface

Two ml of fibrin glue are injected over the urethra

The buccal mucosal graft is applied over the fibrin glue

The distal urethra is pulled down and the proximal urethra is pulled up to cover the graft

The distal and proximal urethral edges are sutured together along the midline as an end-to-end anastomosis

Two ml of fibrin glue are injected over the urethra to prevent urinary leakage

Results on 24 patients who underwent augmented anastomotic repair using dorsal oral mucosal graft

Mean follow-up 48 months (25 – 78 months)

SP?

Conclusions

- Reconstructive surgery for urethral strictures is continually evolving and the superiority of one approach over another is not yet clearly defined
- The reconstructive urethral surgeon must be fully able in the use of different surgical techniques to deal with any condition of the urethra at the time of surgery

Scientific Session at the 2009 American Urological Association

(AUA) Annual Convention

Chicago, Illinois, USA

April 25-30, 2009

Topics to be presented and discussed

Failed Hypospadias Repair Presenting in Adults: A New Outbreak?

Point-Counterpoint. Bulbar Urethroplasty: Transect or Not Transect the Urethra?

Does Penile Length Affect Surgical Steps and Outcome of Posterior Urethroplasty?

www.urethralcenter.it

Next month, this lecture will be fully available on our website

Thank you !
